Pouyan received his PhD degree in Mechanical Engineering, manufacturing and production, from the University of Tehran, Iran in 2017 focused on experimental-numerical modelling to determine nano-composite adhesive joints strength. In 2019, he started his postdoctoral research focused on degradation of composites – Decay project funded by University of Galway and the IComp centre, Ireland.

**Dr. Noel Harrison**

Dr. Noel Harrison is a permanent Above the Bar lecturer in Mechanical Engineering in the School of Engineering at University of Galway since January 2016. He has a significant track record in advanced computational mechanics, experimental testing, material characterization, additive manufacturing and 3D printing of metal and polymer feedstock, and 3D microscopy. Dr Harrison is a Funded Investigator in the SFI research centre I-Form, for advanced manufacturing and a Principal Investigator (and University of Galway representative) in the Irish Composite Research Centre IComp.

**Dr. Tomás Flanagan**

Dr. Tomás Flanagan has a PhD from the University of Cambridge Engineering Design Centre, focused on design project planning and management with special emphasis on simulation and risk analysis. He has worked in roles as Turnaround Project Manager at BP Norway and Offshore Construction team lead in BP Angola. He has also held roles in change management and in-house consulting within BP. Prior to that, Tomás gained experience in process model elicitation at Perkins Engines and Rolls Royce Aerospace and fatigue testing at Boeing Commercial Aircrafts Group.

**Irish Manufacturing Research (IMR)**

Irish Manufacturing Research, IMR, is a leading Research and Technology Organisation providing a portfolio of research, training and consultancy services to Industry across four thematic pillars: Digitisation, Sustainable Manufacturing, Design for Manufacturing such as additive manufacturing, Automation and Advanced Control. IMR works with Irish Industry to assess ways to reduce energy consumption and how best to adopt a circular economy approach within their supply chain. IMR’s vision is to enable manufacturing of all sectors and sizes to be leaders in the world of advanced manufacturing so that they can compete and thrive in the global economy.
ÉireComposites was established in 1998 and has over 60 employees. The company operates an accredited composites manufacturing and testing facility in Inverin, Galway. ÉireComposites is a design, manufacturing and testing company involved in lightweight high performance fibre-reinforced composites materials. The company was founded as a spin out from University of Galway and maintains a strong research and development (R&D) focus. Their facilities are equipped with some of the most advanced equipment required for composite component manufacture.

Pouyan's project

“3DRecComp - Recycling environment and industrial waste composite and polymer materials into raw material extrusion feedstock, and the development of 3D printing of composites”

On the 16th January 2018, the European Commission published a European Strategy for Plastics in a Circular Economy requiring all Member States to reuse and recycle 50% of all plastic waste by 2025 and 55% by 2030. The excess production of composite materials in recent years, thereby huge volume of post-industrial trimmings and off-cuts from composite industries has started affecting highly our environment. Carbon and Kevlar fibres are high expensive materials; therefore, their waste in industry is a precious resource for recycling goals. 3D Printing (specifically Material Extrusion Additive Manufacturing) is a rapid and convenient manufacturing method. The technology has moved from laboratory rapid prototyping to consumer and domestic grade equipment over recent years. This process is suitable for use of recycled plastics and fibres from industrial waste, however to date, no clear recycling methods has been developed to convert waste composite and polymer parts into raw filament feedstock. To achieve this, this project relies on the expertise of a collaboration formed by ÉireComposites, the Technology Centre IMR, and University of Galway.

The main steps of the proposed research program are as follow: collecting end-of-life composite parts, industrial wastes and environment waste (fibres and plastics); sorting of collected materials; use of recycling techniques to reuse composite waste (separation of fibres and plastics); modify and optimise recycling process for different materials; design and modify filament making methods; manufacturing filaments from recycled waste (fibrous filament and non-reinforced filament); quality control of filaments; design and optimization of a 3D printer in terms of hardware and software; 3D printing of new advanced components made of recycled filaments; mechanical testing and physicochemical characterization of 3D printed recycled composite parts to assess effect of fibre added and recycling process on the mechanical behaviour of new developed components; numerical simulation.
